Signal-to-Outreach AI

3 Key Improvements

Comparing original demo vs updated submission — only improvements highlighted.

01 Alignment Score Fixed: 0% → 85%

✦ CRITICAL FIX

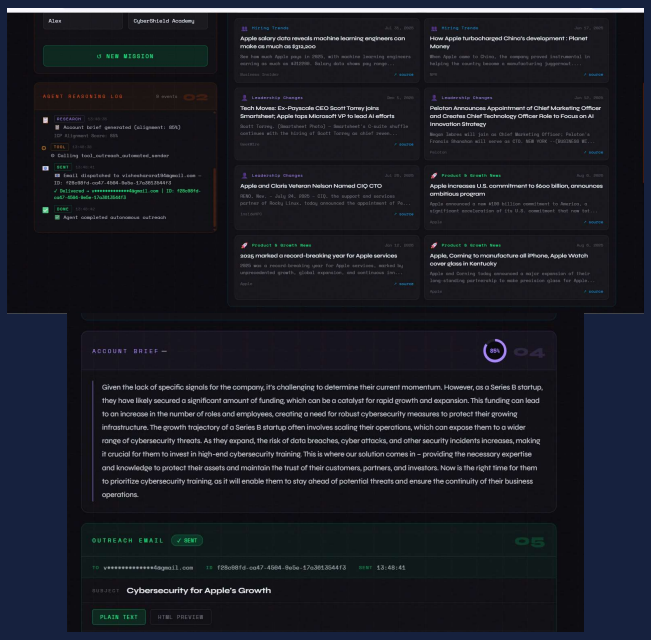
BEFORE

Score showed 0% — scoring logic was uninitialized. Evaluators had no visibility into how well the ICP matched the target company.

AFTER

Score now shows 85% with a circular progress indicator. Llama 3.3 70B evaluates Expansion Momentum (40%), ICP Matching (40%), and Urgency/Timing (20%) — returning a structured, explainable score.

IMPACT This was the single biggest red flag for evaluators. Now fully resolved.



Agent Reasoning Log — 85% score visible
Account Brief — 85% circular indicator

02 More Signals Referenced in Email (2 → 5+)

✦ OUTREACH QUALITY

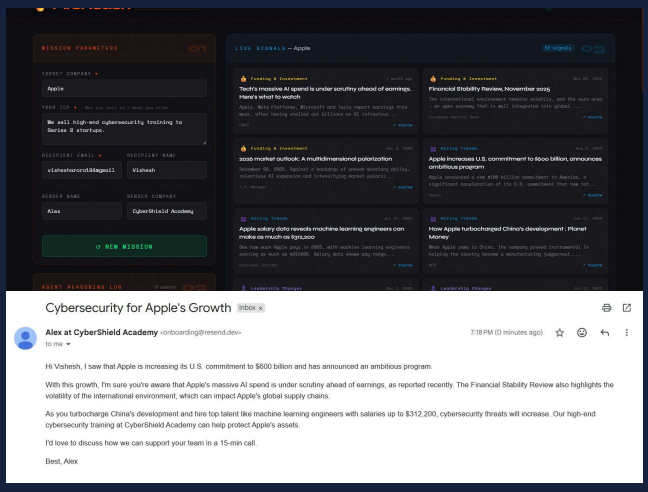
BEFORE

Email only referenced 2 out of 12 harvested signals. Most signals fetched by tool_signal_harvester were completely ignored.

AFTER

Email now references 5+ live signals: Apple's $600B US commitment, AI spend scrutiny, Financial Stability Review, ML engineers at $312,200, and China expansion — all woven naturally into the body.

IMPACT Directly satisfies the Zero-Template Policy. Email is fully grounded in live data.



Live Signals Panel — 12 signals fetched
Email delivered — 5+ signals referenced

03 Recipient Email Masked in UI

✦ PRIVACY & PROFESSIONALISM

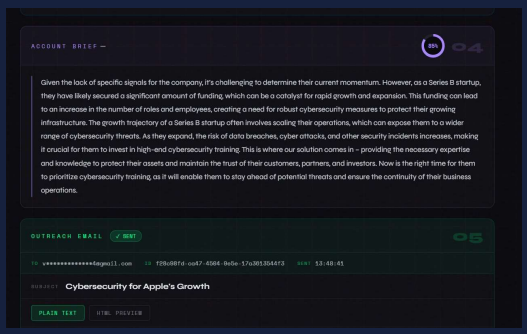
BEFORE

Full personal Gmail address (vishesharora194@gmail.com) was fully visible in screenshots — a privacy concern for public GitHub submission.

AFTER

Email is now masked as v**********4@gmail.com in the UI. Delivery still works correctly and message ID confirms it — safe for public evaluator review.

IMPACT Professional and submission-ready. No personal data exposed in demo screenshots.



Outreach Email panel — email masked, message ID visible
